

Common zero-exposure training background (q0)

Onion: 240 sources / 480 images Potato: 268 leaves / 536 images

Joint replacement

48 onion or 54 potato probe sources per allocation
30 splits; five complementary allocation pairs

Single-source replacement

One paired probe source at a time
First 10 splits; every paired probe retained

Within either design: identical donor deletion

E and H remove the same mapped source(s); the remaining background is shared

Related-view exposure (E)

Insert two non-anchor views
from each selected probe source

Ordinary replacement (H)

Insert two views from each reserved source
with the same original class

Evaluate the same fixed anchors in both arms

Probe anchors held out; sentinels never exposed
Identical training-image counts and original-class support
